

K. Ephemeris. 1694

Mercurius Anglicanus,
OR THE
English Mercury:
Being a Double
EPHEMERIS

For the Year of our Lord

1694.

Heliocentrick and Geocentrick

Exactly Calculated from

ASTRONOMIA CAROLINA,

For the Meridian of London,

With Monthly Predictions thereon; and several
Varieties of singular Use.

Being the Second after *Bissextile*, or Leap-Year.

The like not Extant.

By **GEORGE PARKER**, a Lover of
the Cœlestial Sciences.

London: Printed by *Benj. Motte*, for the Company of
STATIONERS, 1694.

T O
The Right Honourable
Sir John Fleet, K^t,
(At the Writing hereof)
LORD-MAYOR
OF THE
City of L O N D O N :
And O N E of its
REPRESENTATIVES
In the H O N O U R A B L E
House of Commons.

My L O R D,

Among the rest of your Honor's Admirers; I
could by no means conquer the Temptation I
lay under, to take the Liberty of endeavour-
ing to Eternize your Memory by this Dedication.
Having by a Continuation or Series of Observation upon
the most Eminent, who have drawn the Eyes of the
World

The DEDICATION.

World after them (especially for the discharge of distributive Justice) found, that none have signalized themselves more eminently than your Lordship. And such an Administration: which, were it left to the determination of the most invidious, after scrutinizing your Actions for the whole Year; they would be necessitated to confess the same. Not that that is the only Culminant Vertue inherent in you; for 'tis obvious you have been a steady Adherer to the Interest of the Crown, and thereby encouraged all its Loyal Friends; have defeated Faction, when it broke the Method of Ancient Custom, and thought to have interested itself under your Lordship's Protection. A Happiness I hope this Small Piece may meet withal; and this Boldness of mine your Pardon: if so, I shall rejoyce in the Felicity of Subscribing my self,

Your Lordship's

most humble Seivant,

GEO. PARKER.

of

Of the Equation of Time, and its Use. How to regulate a true made Pendulum Clock or Watch, shewing what it ought to differ from a true Sun-Dial.

I N my last Year's *Ephemeris* I gave a short discourse concerning the right managing of a Clock or Watch; shewing when and what it ought to differ from a true Sun-Dial: it being a thing very desirous and useful to several Gentlemen and others that are delighted with these pleasant Speculations; and being this may come into the hands of those that did not see it the last Year, I think necessary to continue it, as followeth.

In the Fourth Column of the *Kalendar Page* is the Equation of Time in *Minutes* and *Seconds*, as the Letters *M* and *S* on the top signifie, and hath the Title *Watch too fast* or *Watch too slow* in every Page; which is adjusted to every Day in the Year: and its excellent Use, is as followeth.

Notwithstanding all Persons conclude that the *Sun* by his Motion sheweth the *Apparent* time of the day, which is true; and that a *South Sun* always makes *Noon* or 12 a Clock; yet this Southing of the *Sun*, or the space of time from one *Noon* to another is not equal, but longer or shorter according to the *Sun's* Position in his *Ellipses*; so that it is impossible for any Clock or Movement whatever to keep time therewith. For this reason many Persons that are furnished with excellent *Movements* very often blame the *Artist* that was the Maker, when the Errors lie where they are not capable of discerning; for if a *Clock*, truly rectified be set by the *Sun*, and kept going a Year, and at the Year's end agree exactly again with the *Sun*: yet in the *interim* it would be found, at several times to deviate considerably; and be sometimes too fast at other times too slow. The reason of this difference is, the *Clock* measures Time equally, but the *Sun* unequally: The Quantity of this Difference is, as before exprest, which I will further exemplifie thus.

Admit on the first of *February* I would set a Clock to shew the equal time of the day; I look in the *Kalendar* against *February* the first, and there I find 14 Minutes 48 Seconds, with

Of the Equation of Time, &c.

the Title *Watch too fast*, which informs me that I must set my Clock so much faster than the time given by a *Sun-Dial*, and then being kept going it will, by the first of *March*, be but 10 Minuts too fast, and on *April* the fourth the Clock and Sun would agree together exactly: Afterwards the Clock would begin to be slower than the Sun, as is noted in the *Kalendar*.

Thus by knowing the equal time, you may at any time, by the help of this Table know the true or apparent: for look against the day of any Month and find the *Equation*, which if it be *Watch too fast*: then subtract that day's *Equation* from the time given by the Clock, and it will be the apparent time: and if it be *Watch too slow*, then contrarily add the *Equation* to the time noted by the Clock, and you have your desire.

But in the right managing of *Clock* or *Watch*, it ought always to be examined by the same *Sun-Dial* it was set by, and at or near the same hour too: for there is often difference in *Sun-Dials*, and withal not to set the Clock by the Sun early in the *Morning* or late in the *Afternoon*, for then the Shadow on the *Dial* is not the true time of the day, in regard the Sun hath then considerable *Refraction*, which makes it appear higher in *Altitude* than really it is, and the nearer the *Horizon* the greater, so that the time given by the Sun is later in the *Morning* than truth and the contrary in the *Afternoon*. Therefore to observe the true time of the Day, let it be always near Noon if it be a *South* or *Horizontal Dial* that you make use of; but if it be a *Quadrant* or other Instrument, it ought to be done with great Nicety, in regard the Sun, between the hours Eleven, Twelve and One differs but few degrees in *Altitude*.

According to *Astronomia Carolina* T. A. ☉ enters.

This Table readily shews the Interest of any Sum of Money in Pounds, Shillings, Pence, and hundredth part of a Penny, where- of 25 is the value of a Farthing, 50 of two Farthings, and 75 is equal to 3 Farthings. And whereas our months are unequal, some consisting of 31 days, others of 30, and one of 28. I have com- puted the Interest to a month of 30 days, it being a mean between the two extremes.

Of the Eclipses for the Year 1694.

THere are Two Eclipses of the Moon, and as many of the Sun, in the order following; as I received them from my constant Annual Friend.

I. The first is of the Moon, and ushers in the year, being on *New-years Day* about Noon. It will be invisible to all *Europe*, but in *America* it may be seen in the setting Moon; and the greatest part of *Asia* may see it in the East. In the Meridian of *London* it begins at 10h. 27' in the morning, and ends 25 min. after Noon. The quantity Eclipsed scarce 4 digits, on the North side of the Moon.

II. The second is of the Sun, *June* the 12th. *P. M.* The central shadow enters on the disk of the Earth in the great *South Sea*, to the *S. W.* of *California*, whence passing on Eastwards it traverses the south end of that Island, and the Country of *New Granada*: From thence proceeding over the unknown Lands of the *North America*, it at length comes to the *English Colonies* of *Virginia*, and *Maryland*, where, about Eleven in the morning, the Sun will appear with a Luminous Ring, about the dark Body of the Moon. When having long kept the parallel of 38 and 39 gr. of Latitude, it crosses the *Atlantic Ocean* tending again to the Southwards; and leaving the *Isles* of *Cape Verde* on the right hand, it enters on the main of *Africa* about *Cape Verde*, and at last sets centrally Eclipsed, near *Cape Coast Castle* in *Guinea*. The partile shade reaches over the whole *North America*, and the Western parts of *Europe*, and of *Africa*. It will be visible at *London*, beginning at 4h. 25'. *P. M.* about 5 deg. to the right hand of the *Nadir Solis*, and Ends at 5h. 43'. the Quantity just 2 digits on the South side of the Sun.

III. The third is of the Moon, *June* 27. about one in the morning; that that is of it will be visible, but it will scarce amount to half a digit on the South side of the Moon. It will be well worth observing what the just Quantity is, as tending to ascertain the Theory of the Moons Latitude.

Of the Eclipses for the Year 1694:

IV. The last is of the Sun, *December* the 6th. in the Evening. It cannot be seen in *England*, but the total shade enters on the disk of the Earth in the midst of the *Mar-del Zur*, in about 1 gr. South Lat. and from thence tending Southwards it enters on the Coast of *Peru* near *Polos*, where it will be Central about Noon. Thence it traverses the Continent of the *South America*, and leaves it on the North Parts of *Brasile*, passing into the *Ethiopic Ocean*. The Sun sets totally Eclipsed in the Latitude of 6 ge. North near the Coast of *Guinea*. The partile shade reaches over the whole *South America*, and the West Parts of *Africa*, as far as the *Canary Isles*, but can scarce be visible to any part of *Europe*.

The Explanation of the foregoing Table.

I Refer my Reader to my last year's *Ephemeris* for the Explanation of this Catalogue which was given me by the same Person who furnished me with the Catalogues of the two former Years. He thinks fit further to advise,

That the Eclipses of the first *Satellite* are the most proper for determining the Difference of the Longitudes of distant Places, not only because they happen the ofttest, and may be seen distinctly with a good Glas of 8, 10, or 12 foot, but also because its Motions are found most regular. The Eclipses of this *Satellite*, which have been observed last year, hapning four or five Minutes later than the calculated times in the printed Catalogues.

This Year he expects the Tables will agree nearer with the Observations (not only in this but the other three *Satellites*) than they have done the two former Years; by reason the Planet *Jupiter* now passes over the South Intersection of their Orbit with his, but the Observer must not expect so near an agreement of their calculated Eclipses with the Heavens as he finds in the first, by reason their Motions are not yet so well known as the others are.

And tho he gives here only the Catalogue of such Eclipses as will be visible in *England*, yet may others not visible with us but under remote Meridians be easily derived from them, by adding or subtracting the time of one or two Revolutions of any *Satellite* (as need requires) to or from the time of the next Eclipse of that *Satellite* in the Catalogue.

	d.	h.	'	"
The Mean Revolution of the first is made in.	1	18	28	36
of the second ———	3	13	17	54
of the third ———	7	3	59	36
of the fourth or outermost in	16	18	5	3

If it be required when the next Eclipse of the first *Satellite* after the fifth of *Jan.* shall happen. To the time of it in the Catalogue *Jan.* 5^d 4^h 16', if you add the time of one Revolution 1 18 28³/₄, it gives the time of the next Emerſion *Jan.* 6 22 44, when it again emerges or comes out

Explanation of the Satellite Table.

out of *Jupiter's* shadow ; at which time the Planet is under the Earth to us, but new risen to the Inhabitants of *China* and *Japan*, whose Meridian lies 7 or 8 hours to the East of ours ; where therefore it may be observable, the seventh day in the evening, and wherever it be observed the difference of the time it happens from that noted in these Tables, will not be more than a degree bigger than it ought ; but may be attained exactly by comparing the Observation of it with such as shall be made near the same time at the Observatory, if God indulge us with Health, Peace, and seasonable Weather.

Again, the Catalogue shews you, that on the ninth of *Feb.* at 17^h 8' there will be an immersion of the third *Satellite*, or that it falls into *Jupiter's* shadow, and is totally eclipsed in it. If the time of the next following immersion be desired, add to this the Revolution 7^d 03^h 59' $\frac{2}{3}$ it gives the time of the next Eclipse *Jan.* 26 21 07, at which time the Planet is set with us, but it may be seen in the *West-Indies* and all those places whose Meridians are more than four hours removed to the West from ours.

The Tables of the Sun's declinations in the *Ephemeris* will be of very good use to our *Mariners* for finding the Latitudes of Places by Observations of the Sun's meridional heights, or Zenith Distances.

And these *Satellite* Eclipses may be as useful for determining the true Longitudes of the Capes or Head-lands on which they land at any time ; and when these are once settled, the Work is half done. They will know exactly where the place lies to which they sail, and this will encourage them to employ their utmost diligence to use the same expedient for finding out the true place of their Ship at Sea. For their use this *Ephemeris* is mainly designed, and I shall endeavour to make it every year more useful to them by his help who has imparted these Catalogues to me for their service.

A Table, whereby knowing the Price of the Pound, you may know the Price of the Hundred weight: the use whereof is easie; for look in the Column under 1 Pound weight, and in the next Column to the Right Hand is the Price of the Hundred Weight.

M D The Heliocentric Ass

OBSERVATIONS:

B Old Britain blush, and peep with
half an Eye
Asham'd to look on Murthered Ma-
jesty.

A monstrous Brood of *Rebels* did
undo

The best of *Kings* ; but made him
Martyr too.

Here's nature's Paradox Rebellion
brings,

To answer at his Bar the best of
Kings.

On the 30th. of this month, 1648.
King Charles the First of precious
Memory, after a Mock Tryal, was
Barbarously Murteered, before his
Palace Gate of *Whitehall*.

The Heliocentric Aspects

OBSERVATIONS.

THE dismal year 1693. is over ; but we shall have cause for some time to remember the dismal Effects that happened therein. The triple 3 of ♄ and ♃ from the sign *Gemini* and *Sagittary*, have shewn their effects to the purpose already, and *London* in particular hath shared sufficiently in it. The *Turkey* Merchants are proper Persons, beyond contradiction, to give an account of its Malevolency. Neither have the rest of that Cities worthy Traders been exempted from its secret Influence, is demonstrable, by the general complaint for want of Trade : Besides the scarcity of all Commodities tending to the sustenance of the Body, viz. Bread being at 12 s. the Bushel, &c.

On the 17th. day about 8 at night, the Moon will be seen passing about her Semidiameter above *Venus*, and will be a very remarkable spectacle.

The Heliocentrick Aspects.

OBSERVATIONS.

Saturn is got into Capricorn, in Opposition to *Hollana's* Ascendant. He is no friend to that People, tho by their gesture and deportment, he might be taken for their Patron. He is in a sign cold and dry, of his own Nature, and in square to *Sol*. He portends great colds, and Death of great Persons; *Contentiones divitum*, Animofities betwixt persons of the highest Rank. I hope the good Angel of God will direct his Majesty so, that by his Wisdom, such like accidents will be prevented in his Dominions. The many cross grain'd Configurations of the Planets in this month, move many unquiet spirits to be disturbing the publick Peace, and to thwart the Commands and Actions of their superiours. I question not, but they are met withal in the end, and chastised for their folly. Cannot dear bought Experience make people wise.

☉ The Heliocentrick
Aspect.

OBSERVATIONS.

THE Resolutions of Princes now
seem fixed, and great preparati-
ons for War are made for Sea & Land.
the *English* are as much concern'd
as any others, and make a formidable
Figure. ♀ for a considerable time
hath made her abode in ♃, where
she hath waited to accost the Sun;
tis by a retrograde motion, conse-
quently her beams dart the more pow-
erfully upon the Earth. All things
seemingly go fairly on; and an har-
monious agreement appears betwixt
King and People. *Mars* in ♄ darts his
angry Atomes to the ☉ and ♀ in ♃
some misapprehensions like to be in
Ireland, or a Report of some mischief
done there to the Merchants Trading
to the Western Plantations; a nimble
People of their Tongues from a mole
Hill, raise a mountain; yet 'tis to be
feard some losses may have happen'd.

Venus in the late 20 years *Ephemerides*, errs again 2 deg. *Fere.*

The Heliocentrick Aspects.

OBSERVATIONS.

Three of the seven Planets are, and have been since the year began, in Cardinal Signs, which manifests the Transcendency of Actions now apparent all over *Europe*. All persons in their proper Posts are vigilant and busying themselves for the approaching Campaigne; yet I do not expect any material Action or Engagement in this month, rather great preparations tending thereto: For the Planets do not behold one another with any material malevolent Aspect. Besides ♄ beholds the place of the last ☿ of ♄ and ♀ with a friendly Ray. For this reason I suppose the impending Effects of the late ☿ will be retarded or kept back for some time.

And whenever there be an Engagement, *Heavens* grant the *English* a thundering Victory.

26	♈ 1	♉ 38	♊ 4	♋ 1	♌ 3	♍ 27	♎ 14

OBSERVATIONS.

Many unlucky Counsels are now on foot for the destruction of Mankind : for the Month is ushered in with a crowd of Heliocentrick Aspects, and some of them are of a malignant Nature, viz. \square h v . g x z . g g v . they all happening together. But most pernicious is that hateful g h \ominus or g \ominus h and at the same time \ominus suffers a visible Eclipse, and v is opposed by h : as here is variety of matter, so likewise its Effects be felt divers ways ; and as there is much Mischief impending, so great part will be manifest in this Month. the remainder in the succeeding, *July* and *August*, many Buildings ruined, many Countreys depopulated or much wasted. And among these Calamities the death of many great Persons is threatned of Kingly or Princely extraction.

The Heliocen
trick Aspects

OBSERVATIONS.

Heavens divert the *Turks* near these months from further vexations, either to the Emperour or his Allies; and grant a Peace may be accommodated with that People; that there may be opportunity to turn the edge of the Sword against the common disturber of Christendom. *Saturn* is Retrograde still in *Sagittary* and *Mars* beholds him with a quartile Aspect, and *Venus* with an Opposition. Many Miseries, Controversies, and Oppressions is still predominant, especially in the Eastern Regions. Neither is *London* (I doubt) altogether free from their dire Influence.

The *French King* seems to be very active, yet much Poverty continues among his Subjects, for want of Trade, at which the Vulgar Man is discontent, ready to complain and sue for ease, if he knew to whom.

The Heliocentrick Aspects

OBSERVATIONS.

Many notable Accidents, which have signification from the male Configurations of the two last months, may have Effects in this; for notable Events, or matters of great Consequence, cannot appear in an instant, but leisurely, and in convenient time; and 'tis very probable we shall have intelligence this month of some brisk Rencontre or martial Action, performed Eastwards. Saturn is now become direct, with whom ♀ hath been lately conjoynd Heliocentrick. ♄ & ♂ from the like position behold each other with a quadrat Aspect from fix'd Signs; whence, or from their influence strange oppositions appear in great Councils; many discontented Spirits shew themselves in their Colours, to the disturbance of the Magistrates in several Countries and Nations of Europe: Nor are we in England free from the designs of hot spirited Male-contented Persons, who labour much to set all in a Flame & Confusion.

The Heliocentrick
Aspects.

OBSERVATIONS.

WE are not yet free from doubts
and fears of approaching Dan-
gers; notwithstanding strong endea-
vours are used to reconcile many dif-
ferences now in debate. Yet I hope
for a better understanding of matters
at present in question: and that the
end of our fears may terminate in
peace and safety. The good hand of
Providence seems to direct this Na-
tions Councils and Actions; so that we
need not fear the subtle Plots and De-
signs of our most inveterate and secret
Enemies. Therefore let not the Sub-
jects repine and think themselves wiser
than their Governours: Nor let us be
too forward to scandalize or suspect
the most hopeful endeavours and
Consultations of our most grave and
prudent Worthies.

The Heliocentrick Aspects

OBSERVATIONS.

Saturn hath now got full possession of his own Territories, or domal Dignities; and upon his arrival is congratulated by all the Erraticks, except ♄, whose great soul scorns to do homage to vile miscreants, albeit invested with power and authority, but with submission resigns to Fate: and is secure too, whilst in reception of noble ☉, who in the end is never wanting to reward all commendable and honest Performances, &c.

The only Rebels of the starry sky are now united, with whom ♀ is joined in consultation, 'tis in ♄ an earthy sign. Some secret and hidden contrivances are now on foot, if against the Government, which there's great cause to fear, let the Contrivers and Abettors look to it, for ☉ discovers all their villainy. *Holland* be vigilant and active, thou seemest to be concerned more directly in it; 'tis in opposition to thy Ascendant, &c.

In the Kalendar aforegoing, among the Heliocentrick Aspects, the Planets are often noted with ♄ and ♅, which the ingenious Tyro in this Science, is to understand, that such a Planet is then in his own Node; and on that Day changes his Latitude. A useful Thing to be understood.
